

**WARNING:** THESE TINES ARE NOT DESIGNED FOR DEEP CORE AERATION. THEY ARE FOR ORGANIC MATERIAL REMOVAL ONLY. FOR BEST RESULTS, **DO NOT EXCEED A DEPTH OF 2 INCHES.**

- Unlike a traditional coring tine which is driven deep to fracture the soil and create pathways for water movement, Ninja Tines are designed to work in the organic layer only.
- Ninja Tines require a 3/8" mounting block from all equipment manufacturers.

#### **CONGRATULATIONS**

You have purchased a superior quality, precision tool engineered for the specific surfaces of golf course putting greens. As with all precision tools, these tines require care and attention to reach their maximum potential. The notes provided below are intended to maximize their benefit to you while keeping you and your staff safe.

1. Install & remove tines in accordance with machinery manufacturer's instructions.
2. Keep extremities away from machines during operation. Tine tips are sharp and may pierce the skin.
3. Wear appropriate PPE as recommended by manufacturer of aeration machine to prevent impact from thrown debris, rocks and chipped tine edges.
4. Inspect tines for chips, cracks, bending or other obvious damage before and after each use.
5. To avoid premature corrosion, keep tines in protected packaging until time of use.
6. The tine tips are precision heat treated and machined. They are not intended to pierce hardened, compacted or rocky soils or surfaces.
7. Use all safety shields and devices. Do not alter or disable any machine safety mechanisms.
8. During storage or use, keep away from chlorinated compounds or solutions such as bleach, pool chlorine and other strong acids or bases.
9. Treat these tools as you would any other sharp golf course tool.
